# YOUR INDUSTRY INSIGHTS

## Combating the threat of Antibiotic Residues in food

Antimicrobial resistance caused by veterinary medicines poses risks to human health, but a new, breakthrough testing kit from Dr Ehrenstorfer can help laboratories detect antibiotic residues more quickly and efficiently.

Veterinary medicines are used as both a preventive and a cure for a variety of diseases in production animals. Food products sourced from treated animals, may contain residues of these medicines for example, in eggs, meat or milk. A 2019 study by Sachi et al highlighted the use of antimicrobials in animals suggesting that levels of antibiotic use in animals is more than double that of humans. The Food Standards Agency (FSA) has developed guidance for milk producers to ensure acceptable standards of hygiene are maintained and that the legal requirements for antibiotic residues are clear. This guidance does not consider instances of contamination through fraud or error therefore testing of food products before they enter the food chain is essential.

A 2013 study by Executive Agency for Health and Consumers highlights that in total there are 3000 active pharmaceutical ingredients currently authorised on the EU market and over 4000 (APIs) authorised for use worldwide.

The EU lists over 200 pharmacologically active substances and their classification regarding maximum residue limits of veterinary residues permitted in food-producing animals and animal products under regulation (EU) No 37/2010 to control the presence of these substances in the food chain.

Likewise, in the US, the Food and Drug Administration (FDA) publishes the Green Book which has sections that provides myriad information about animal drugs including trade names, application number, and active ingredient. As of 2019 there were a total of 327 small molecule drugs are listed in the Green Book with around 51% approved for use in animals and humans and 49% approved for use in animals only.

[lgcstandards.com/drehrenstorfer](https://lgcstandards.com/drehrenstorfer)

Build-up of these substances in the food chain can enable the development of antimicrobial resistance in bacteria which perpetuates the need for stronger and more potent antimicrobial drugs.

A 2018 report by European Food Safety Authority (EFSA) summarised veterinary residue monitoring data in live animals and animal products collected over a 10-year period. Many samples were collected but the majority originated from inside the EU where there are strict controls on the use of veterinary drugs in animals.

- The percentage of samples that exceeded the maximum levels was 0.3%
- Comparable to the previous 10 years (0.25%-0.37 %)
- A total of 657,818 samples were checked by 28 EU member states.

The report highlighted the need for closer monitoring of products imported into the EU with 0.4% of samples (3,022 sample size) identified as non-compliant and, of the total samples, 0.13% were found to contain unauthorised substances. Outside the EU however, drug products are not always used for therapeutic reasons – with their potential for use as growth promoters (hormones, beta-agonists, etc) particularly in countries where regulations or monitoring are not as strict as the EU. It has also been observed that some countries manage two food control systems, for products intended for domestic and international markets. This enables them to use veterinary medicines more freely in the domestic market. Therefore, screening of animal products entering the food chain can help to control the number of potentially harmful food products.

Veterinary drugs are one of the most chemically diverse group of compounds and metabolites, so it is technically challenging to develop a single multi-residue detection method to cover them. The number of sample preparation approaches is also diverse, with different sample extraction and purification procedures needed for each matrix of interest.

Most modern test methods are based upon LC-MS/MS, sometimes in conjunction with GC-MS/MS, to provide a high sensitivity and selectivity for a wide scope of chemical classes within a single multi-residue test method. The time and level of expertise needed to prepare a stable multi-residue reference material is the biggest challenge that laboratories encounter.

To ease the burden for laboratories, LGC Dr. Ehrenstorfer has developed PharmaVetResiMix to enable rapid screening of 59 analytes for liquid chromatography (LC) in just four ampoules. These solutions can be combined in just three minutes to create a single solution providing a working standard for the day. Calibration, takes just 30 minutes, optimising a laboratory's efficiency and analytical performance.

You can extend the scope of Dr Ehrenstorfer's PharmaVetResiMix with two additional analyte groups, 10 Tetracyclines and 23 Beta lactams.

Designed for optimal elution and maximum stability, this product is the first of its kind. A mass screening and spiking method-validation product that doesn't sacrifice quality or reliability in providing you with a solution to increase efficiency and accuracy in your analytical processes.

# TECH TIPS FOR USING YOUR REFERENCE MATERIALS

To help you we've captured some key questions asked about our reference materials and getting the most from your products:

1

What is the difference between ISO Guide 34 and ISO 17034 produced reference materials?

ISO 17034:2016 specifies general requirements for the competence and consistent operation of reference material producers. It also sets out the requirements in accordance with which reference materials are produced. It is intended to be used as part of the general quality assurance procedures of the reference material producer.

According to International Organization for Standardization, ISO 17034 replaces the ISO Guide 34 and in doing so, changes all recommendations of the Guide into requirements. Thus, there is no difference between how a product is indicated to be produced under ISO Guide 34 and ISO 17034. More relevant changes include inclusion of more detail on the required documentation in accordance with ISO Guides 31. All Dr. Ehrenstorfer products produced under ISO 17034 and their Certificates of Analysis comply completely to the requirements of the accreditation.

2

How do I tell which products were produced under ISO 17034?

As leaders in quality not only are our Dr. Ehrenstorfer production facilities accredited to ISO 17034, we actively produce the majority of our portfolio is under our ISO 17034 scope of accreditation. These materials are clearly identified in the certificate of analysis and in this catalogue by the symbol †. This range is constantly increasing, therefore if you are unable to find the product that you require, please contact your local sales office or email us at [dr.ehrenstorfer@lgcgroup.com](mailto:dr.ehrenstorfer@lgcgroup.com).

3

Can I still use products that are not produced under ISO 17034 for my analysis?

The appropriate reference materials for your analysis are determined by the specific method you are following. All Dr. Ehrenstorfer reference materials are designed, produced and verified in accordance with a registered quality management system ISO 9001 and all analytical measurements were performed under our ISO/IEC 17025 scope of accreditation - ensuring traceability. Our certificates of analyses are designed in accordance with ISO Guide 31, whether or not they were produced under our ISO 17034 scope of accreditation, providing the highest standard at all quality levels.

4

How much material is in the bottle/ampoule?

Dr. Ehrenstorfer reference materials are supplied with a nominal weight or volume and are typically overfilled with up to 10% more of the product than stated. In order to use the material for your analysis, it is usually practical to prepare a solution. The solution preparation procedure described below can be used to calculate the exact amount of material present.

5

The container looks empty – is there anything inside?

Don't worry - Yes, there is! Where small quantities of solid material are supplied, this can be dispersed over the inside surface of the container. Liquid may also coat the inner surface of the container which may not be visible. To best extract all material from container, it is best to transfer the contents with appropriate solvent and dry according to procedure below to calculate the exact amount of material present.

## 6

How can I extract all material from the bottle/ampoule and prepare a solution from a neat Dr. Ehrenstorfer product?

In order to recover all the material from the container the following procedure can be used. We recommend storing the vial / bottle in an upright position for at least 24 hours prior to handling.

- 1 Ensure the container is clean and dry. Using an analytical balance, weigh the container (including the lid for bottles) and record the weight.
- 2 Using a suitable solvent, carefully transfer the contents to a volumetric flask. Rinse the container (including the lid) at least three times and combine all rinses to ensure a complete transfer of material.
- 3 Dry the empty container completely, then using an analytical balance, weigh the dry, empty container and lid and record the weight.
- 4 Calculate the difference in weight between the first and second weighing. The difference in weight is the amount of material that has been transferred.
- 5 Make the solution up to volume in the volumetric flask. The concentration of the solution can then be determined. Where larger quantities of material are supplied, you may wish to only transfer an aliquot of the material. In these cases, you may need to use a weighing boat and a spatula to weigh the material before transferring it into the volumetric flask.

## 7

My Dr. Ehrenstorfer reference material was not shipped under the storage conditions found on the certificate of analysis. Is the product still ok to use?

The storage conditions on the certificate are for the long-term storage of the material. Normally products are not shipped under controlled conditions as shipping times are generally <72 hours and therefore short-term. One sample of each lot is kept aside to enable checks on the specific lot to be undertaken if required.

# WHAT OUR CERTIFICATE OF ANALYSIS TELLS YOU

Every product you receive comes with a Dr. Ehrenstorfer Certificate of Analysis, which provides a full description of the material to which it relates, as well as a summary of the analyses undertaken during the characterisation process.

Purity:	99.02% (g/g)
Expanded Uncertainty (k=2):	-0.88% (g/g)

**9** The uncertainty of this standard is calculated in accordance with ISO Guide 35 and ISO/IEC 17025:2005. Quantifying Uncertainty in Analytical Measurement, Second Edition. The expanded uncertainty is  $U_{95}(p) = k \cdot u_{95}(p)$ , where  $k$  is the coverage factor at the 95% confidence level ( $k=2$ ). Uncertainty  $u_{95}(p)$  is based on the combination of the uncertainties associated with each individual parameter involved in the analysis of the product:  $u_{95}(p) = \sqrt{u_{95}(p)^2 + u_{95}(p)^2 + u_{95}(p)^2}$ .  $u_{95}(p)$  is the uncertainty of purity determination;  $u_{95}(p)$  uncertainty of homogeneity (see 10);  $u_{95}(p)$  uncertainty of stability (see long-term,  $u_{95}(p)$  and  $u_{95}(p)$  are not included in the calculation as the stability statement is based on real evidence opposed to simulation. Minimum sample: 1 mg is recommended as the minimal sample amount. If less material is used, it is recommended to increase the certified uncertainty by a factor of two for half sample and a factor of four for quarter of sample. Intended use: Use this RM as calibrant for chromatography or any other analytical technique.
